

TR-DX2 Operation Instructions

Inductor

The two inductors control the whole advertisement picture. When the pictures go down and the last picture is showing. At the top of the picture, on the right there is a piece of black rubberized fabric attached. The black rubberized fabric goes through the inductor, the inductor induct it, then the pictures go up, changing its direction.

When the pictures go up and the last picture is showing. At the bottom of last picture, on the right there is another black rubberized fabric attached. So the same work is done.

Roller

There are two rollers, one is at the bottom, one is on the top. The advertisement pictures are rolled along the two rollers.

The microcomputer time switcher. Its' description will be attached in my mail

the connection between two Ad pictures used colorless rubberized fabric

The knob used to adjust the time of one Ad picture showing

Inductor

The inductor controls the state of the showing picture. The whole advertisement pictures are connected by rubberized fabric, you can see the connection between two Ad pictures on picture (). On the left of the connection, there is a piece of black rubberized fabric. When the black rubberized fabric goes through the inductor, inductor inducts it, then the whole Ad pictures stop going, one Ad picture is just showing, the showing time is can adjusted by a knob ().
